We wanted to mention that even though the values for port remain as 8 for both packets, in our testing we saw different values appear (e.g. 4 and 2, or 1 and 8, etc.) which confirms that randomization is working. The only visual difference between our waveform and that in the lecture slides is at the end of the first task the iterator value gets reset to 0 whereas in the slides it starts the second task with a value of 1.
